As an active player since its foundation in the field of electroplating, Laboratoire Dubois has acquired extensive experience to serve its customers. Its activities range from advice relating to setting up workshops and effluent treatment systems to inspection of electroplating bath constituents.

Our wide range of analysis options means that we can even take on a great variety of assignments from all fields of surface treatment.

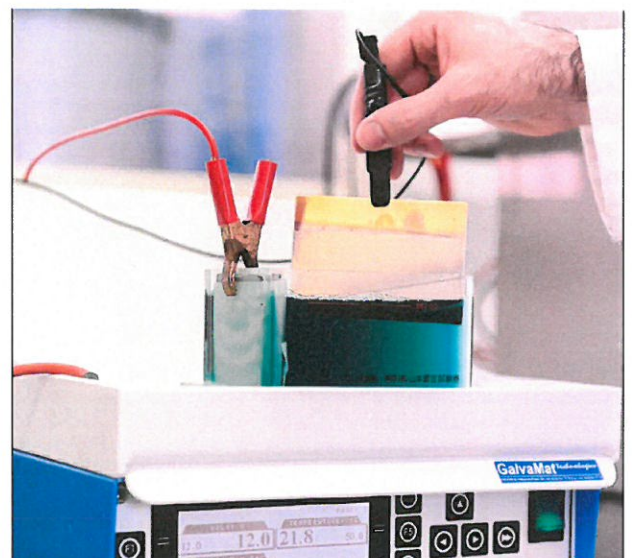

Our regular services include coating behaviour tests in accordance with established standards, determining coating thickness and gold coating fineness.

Please do not hesitate to contact us for installation or waste water treatment projects, for process validation, defect assessment or even testing for washing or hydrocarbon residues on part surfaces. For the latter activity, extract measurement is now ISO 17025 accredited.

Control of an electroplating bath by atomic absorption spectrometry.

Hull cell characterisation of an electroplating bath.
